

Jewelers in smaller cities waste days traveling to major wholesale markets to buy stock. They carry large amounts of cash on public transport which is highly dangerous. They buy new stock by guessing what might sell because they lack real time data. Their shops suffer and lose money while the owner is away traveling. Our software helps them manage their entire shop remotely—from government-compliant invoicing and stock tracking to sales insights and day-to-day operations, all in one place and in an easy manner.					
Mission - To provide traditional jewelers with modern tools that save time and remove the hardship of manual business management while respecting industry traditions, with our B2B marketplace.			Competitive Landscape - Traditional methods like pen and paper stock ledgers. Generic billing software that does not understand the specific needs of gold specification, gemology, diamond specification or jewelry making and the science behind them on why they are costly.		
Key Partners - Our most important partners are actually the wholesale, manufacturers, karigars(goldsmiths), retailer jewelers and anyone in jewelry industry, who use our platform. Since we are building a digital marketplace, we do not need outside corporate partners. Instead we rely on wholesalers from major hubs to upload their catalogs to our system. By putting their inventory online for local retailers to browse and buy, these wholesalers act as our supply partners. They bring the actual value to the platform because without them listing their gold and jewelry, the local shop owners would have nothing to buy. This makes the wholesalers both our customers and the core partners who make the whole system work.	Key Activities The most important thing the company does is build and maintain specialized software that perfectly matches how a real jewelry shop operates. The team takes traditional physical tasks like gold testing and updating handwritten stock ledgers and turns them into easy digital features. Another major daily activity is providing twenty four seven support to make sure shop owners never feel stuck. The company also works constantly to connect local jewelry shops with trusted wholesale vendors in major hubs so buyers do not have to travel.	Value Propositions We offer a single digital platform where jewelers can access trusted wholesale vendors and manage their daily billing without ever having to leave their store. They no longer have to risk carrying physical cash on crowded trains or spend weeks away from their families. We provide real time market data so shop owners can buy exactly what their local customers are asking for instead of just guessing. Our software is completely tailored to the unique daily habits of the jewelry trade because it was built by a founder who actually spent twenty five years working behind a glass counter.		Customer Relationships We build deep trust because our founder actually lived the exact same problems our customers face every day. We do not act like outside tech guys trying to disrupt their lifelong trade. We provide round the clock dedicated support so shop owners know we have their back at all times and never feel abandoned if the software acts up.	Customer Segments Our primary customers are traditional jewelry business owners located in all three tier one, tier two and tier three cities across India. This includes independent jewelers who run a single family owned shop. It also includes larger operations that manage multi city retail chains. We focus entirely on business owners who currently rely on manual bookkeeping and travel heavily for their inventory or use softwares they are not satisfied with.
	Key Resources The biggest resource is the founder who has over twenty five years of real experience working behind a jewelry counter. This includes hands on knowledge of gold refining, diamond grading, gemology, and global trading. Another major resource is the team of passionate software engineers who turn that deep industry knowledge into working code. Finally, the digital platform itself is a massive asset and safely tracks more than ten million inventory items.			Channels We reach new customers directly by having them book a personalized demo with our experts, where we show them exactly how the platform works. We also rely heavily on the tight-knit nature of the jewelry trade to spread our platform through word of mouth among fellow shop owners. We provide easy-to-understand explanation videos for jewellers and run targeted marketing campaigns to reach and educate more potential customers.	
Cost Structure The company has to spend a lot of money paying a skilled team of software engineers to build the platform and keep it running smoothly without glitch. There are also high costs for secure computer servers to safely store all the private billing data and inventory records for hundreds of jewelry shops. Another big expense is paying staff to run the round the clock dedicated customer support desk so users always have someone to call and gov compliances and staff related that.			Revenue Streams The business makes money by charging jewelry shop owners a regular subscription or license fee to use the digital platform for their daily billing and inventory. Since the platform connects local shops directly with big wholesale vendors from places like Mumbai and Jaipur. Our model have more ways to earn money as our platform scales more in future.		
Impact The company is making the jewelry trade completely safe by stopping the dangerous tradition of business owners carrying massive amounts of physical cash on public trains. It gives shop owners weeks of their lives back so they can focus on growing their stores and spending time with their families instead of constantly traveling and can run their busiiness without having to hire an accountant as our software is easy to use even for traditional jewelers.
